Week 11: Describe the data of your project and the visualisations you plan to use. Attribute anything you plan to use from somewhere else. Report the errors and challenges you are facing.

Describing data and visualisations

As previously detailed in my Week 10 documentation, I am using tables 1 to 5 of my research paper and I am representing them in donut, bar and radar charts.

Errors and challenges

I am facing the challenge of drafting the main body of text for the data story in order to tie it in with the data visualisations – I have never written a data story before. While inputting data into charts is relatively easy because it is a direct copy or transfer of the data from the research paper, writing the actual story to make the data story flow logically is a bit tough. I will continue making drafts and researching into what makes a good data story before I finalise the story on my web page.

The recent codealong in week 11 taught us how to toggle between charts so I can perhaps solve my error of trying to switch between 3 charts, though I am not sure if it will work.

I narrowed down on a specific CSS template that I may use but I am facing the challenge of converting the code to match my existing web page, which will probably take a bit of time in order to integrate it to style my web page without any coding errors.
